Exception Handling in My Bus Project

Name : Arvind Vikram M S

In My Current implementation Most service use try catch block and returns tuples

Eg:

```
try
{
}
catch (Exception ex)
{
   return (false, ex.Message);
}
```

Problems:

1. Repeated try catch blocks

almost every service method do this and it looks like repeatating and unwanted checks in controller too.

Eg:

```
if (!result.Success)
{
   return BadRequest(result.Message);
}
```

2. Return ex.message directly:

Returning the ex.message directly will be a security threat as it can expose internal system info , database details , sql errors.

Eg: return (false, $"Payment failed: {ex.Message}");

Solution:

using CustomException (eg.PaymentException) which will allow to modify what to return.

Service class throws own custom exception and the global exception handler handles the exception globally.

Eg:

Service:

```
if (seat == null)
{
   throw new NotFoundException("Seat not found");
}
```

Global handler:

```
catch (NotFoundException ex)
{
return 404 response;
}
```
